
(a) Change vs. the baseline of the same dataset and family (1080 cells)
Only precision improves
12% of cells
Both improve
48% of cells
Both worse
10% of cells
Only recall improves
30% of cells
Δprecision$_\phi$ vs. own baseline
Δrecall$_\phi$ vs. own baseline
UNDER mean (360 cells)
OVER mean (360 cells)
SMOTE mean (360 cells)
(b) Where the F_1^ϕ gain comes from
Linear Model (LM)
SVM
MARS
Random Forest (RF)
CART (RPART)
All families
92% precision
10% precision
83% precision
91% precision
26% precision
85% precision
due to precision
due to recall
mean ΔF_1^ϕ vs. baseline (per fold)
